

## FIX: NuGet Packages Giving Version 11.5 Causing License Issue (OUTDATED)

### **OUT OF DATE ARTICLE**

This article was about an issue arising from 11.5 NuGet packages showing up for installation before the official release of (and thus ability to license) 11.5.

This is no longer an issue due to 11.5 licensing being fully available.

If you're having license related issues with 11.5 now, please ensure you're activating for version 11.5.

If you continue to experience issues, please [Create a Support Case](#).

### **Background**

As of May 2024, Atalasoftware was in the final stages of getting the 11.5 version ready for initial release.

One of the many tasks we have for a new feature release is that we have a significant additional set of steps to get the NuGet package manager to accept our new release for publication. (Adding a new FixPack to 11.4 is fairly quick and does not trigger a new license version, but for moving from 11.4 to 11.5 it does)

In the past, we have waited to push our NuGet packages until we have our official release. The issue is that the overhead of the publishing and vetting process for a new version is significantly higher and we've encountered significant delays of several weeks at times. Rather than risk going live with a new version to find that NuGet packages are "coming but we're waiting on the NuGet side to approve it" we find it easier to just get the new release out early.

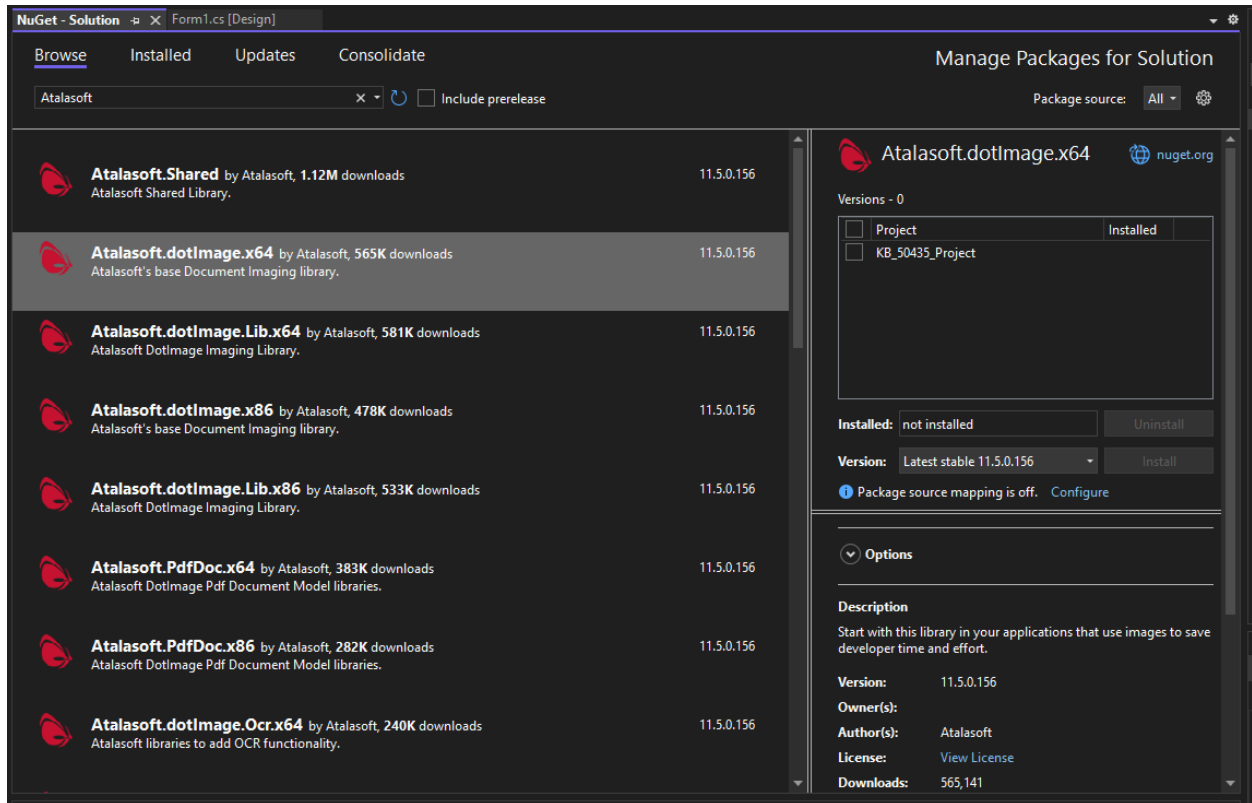

The problem appeared when your licenses were not yet up to 11.5 but the Default Latest Stable option is selected in your NuGet, thus it is installing a version that was impossible for you to license at the time.

### **Workaround**

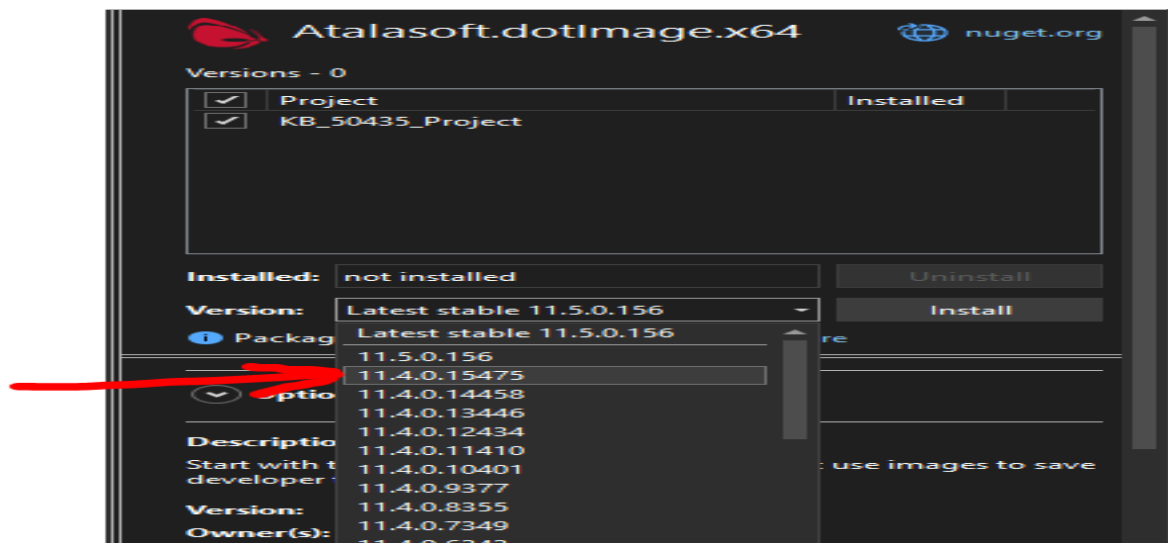

## FIX: NuGet Packages Giving Version 11.5 Causing License Issue (OUTDATED)

For the time being the work around for those using NuGet packages is to specify the version

When you browse for packages you will see them listed as Atalasoftware.SOMETHING.xYY  
11.15.0.000

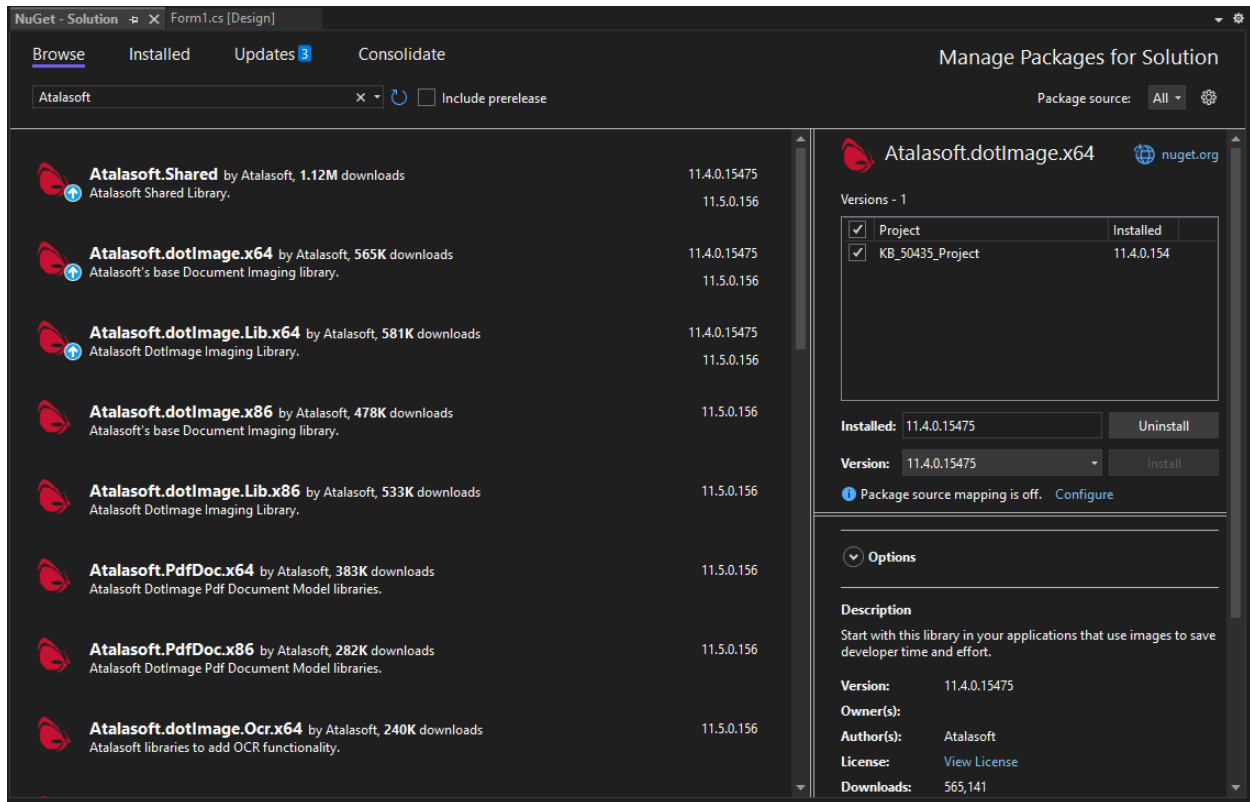

However, if you click on the package the options for install (or upgrade) will let you specify version. Instead of latest, select version 11.4.0.15475

## FIX: NuGet Packages Giving Version 11.5 Causing License Issue (OUTDATED)

Once you select that and click install, it should update the package itself and any dependencies to the 11.4.0.15475 version and update in the main list.

You can now continue to update any other packages you need to install or upgrade (downgrade) to that version for the time being>

That is the final ever 11.4 version. Stay with that until your 11.5 licensing is activated and in place. Then, you can go back to latest.

This WILL happen again any time either the major or minor version (our versions are MAJOR.MINOR.SERVICEPACK.FIXPACK.BUILD) if either major or minor changes, that triggers a new license version, but not for ServicePack, FixPack or Build changes. New Minor builds happen every 6 months to 2 years so it's not too often.

## Permanent Fix

As of the official release of 11.5, we updated all current licenses which were under maintenance at that time to 11.5.

## FIX: NuGet Packages Giving Version 11.5 Causing License Issue (OUTDATED)

So, if you were under maintenance, you should be able to activate for 11.5 and then begin to use the new version. (please read the [Release Notes](#) and [Changes Introduced in 11.5](#) - there is a lot going on in this new version).

As always, if you run into an issue (if for instance you keep getting 11.4 instead of 11.5 licenses please [create a support case](#) and please make sure to include the relevant serial number(s) so we can more quickly assist you.
